

TESTIMONY

CRITICAL INFRASTRUCTURE PROTECTION

> Brassets Group

«Over the past 4 years Brassets Group has been implementing security upgrades for critical infrastructure Government sites around Australia.

We have been required to deliver long range, accurate, layered, and reliable systems in various applications and locations.

We have partnered with HGH to achieve this through passive wide area surveillance at critical infrastructure perimeters. Some of the advantages of HGH hardware and software is the ability for us to integrate the HGH solution with other hardware and software for permanent sites, C2 trailer solutions for mobile detection systems, this has included skids, pelican type cases and even a backpack solution giving us the ability to deliver fully integrated systems that one operator can manage and control which is an excellent outcome to our clients.

We chose HGH after an extensive testing program which included other IRST solutions. The HGH solution not only provided the most accurate detection and tracking outcomes for human and vehicle detection at long range but has provided reliable and robust hardware currently operating in the harshest of environments, without any downtime at any site for the duration of the installation.

We recommend the HGH solution to anyone who requires accurate long range and reliable detection systems for multiple targets.»
